Genomics 15:426-429(1993).

-!- FUNCTION: Essential component of a neuregulin-receptor complex, althought neuregulins do not interact with it alone. GP30 is a potential ligand for this receptor. Not activated by EGF, TGF-alpha and amphiregulin.

-!- CATALYTIC ACTIVITY: ATP + a protein tyrosine = ADP + protein tyrosine phosphate.

-!- CATALYTIC ACTIVITY: ATP + a protein tyrosine = ADP + protein tyrosine phosphate with each of the other ERBB receptors

-!- SUBUNIT: Heterodimer with PRKCABP (By similarity).

-!- SUBCELIULAR LOCATION: Type I membrane protein.

-!- PFM: Ligand-binding increases phosphorylation on tyrosine residues (By similarity).

-!- PCMX MARPHISM: There are fours alleles due to the variations in positions 654 and 655. Allele BI (Ile-654/Ile-655) has a frequency of 0.206; allele B3 (Val-654/Val-655) has a frequency of 0.206; allele B3 (Val-654/Val-655) has a frequency of 0.12.
                                                                                                                                                                                                                                                                                                                                                                                               This SWISS-PROT entry is copyright.    tyrosine phosphate.
SUBUNIT: Heterodimer with each of the other ERBB receptors. The constitutively activated oncogenic variant forms a homodimer.
Interacts with PRKCABP (By similarity).
SUBCELLULAR LOCATION: Type I membrane protein.
PTM: Ligand-binding increases phosphorylation on tyrosine residues
                                                                                                                                                                                                                                                                                                            TISSUE=Neuroblastoma;

-I. FUNCTION: Essential component of a neuregulin-receptor complex, althought neuregulins do not interact with it alone. GP30 is a potential ligand for this receptor. Not activated by EGF, TGF-alpha and amphiregulin.

-I. CATALYTY ACTIVITY: ATP + a protein tyrosine = ADP + protein
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      (By similarity).

Gene 140:251-255(1994).
-!- FUNCTION: Essential component of a neuregulin-receptor complex, althought neuregulins do not interact with it alone. GP30 is a potential ligand for this receptor. Not activated by EGF, TGF-alpha and amphiregulin (By similarity).
-!- CATALYTIC ACTIVITY: ATP + a protein tyrosine = ADP + protein
                                                                                                                                                                                                                                             Eukaryota, Metazoa, Chordata, Craniata, Vertebrata, Buteleostomi,
Mammalia, Butheria, Rodentia, Sciurognathi, Muridae, Cricetinae,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                               -!- SUBUNIT: Heterodimer with each of the other ERBB receptors (Potential). Interacts with PRKCABP (By similarity).
-!- SUBCELLULAR LOCATION: Type I membrane protein.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 -!- PTM: Ligand-binding increases phosphorylation on tyrosine residues.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               -!- SIMILARITY: Belongs to the EGF receptor family.
                                                                                                                                                   15-DEC-1998 (Rel. 37, Created)

This is the human heregulin 2 (Her2) sequence. Immunogenic analogues of Her2 can be used in the claimed method as an autovaccine to induce a CTL response. Subdominant CTL epitopes, antibody binding regions and cysteine residues involved in disulfide bonds are preserved in the immunogenized forms. Regions suitable for the insertion of foreign T helper epitopes were identified (see features table). The method is used for inducing immune responses against weakly immunogenic cell-associated peptide antigens (PA) such as those associated with cancers (self-proteins), e.g. human prostate specific membrane antigen (PSM), heregulin 2 (Her2) and/or fibroblast growth factor NB (FGPB). The method comprises effecting simultaneous presentation by artigen producing cells (APCS) of the animals immune system of: (1) at least 1 Breal group derived from the PA and/or at least 1 B-cell group derived from the PA and/or at least 1 B-cell group derived from the PA and/or at least 1 Breal group derived from the Da animal. Analogues of human PSM, human Her2 and human murine FGPBb comprising a substantial part of all known and predicted CTL and B-cell epitopes of the respective PA and including at cleast one foreign T helper epitope are also claimed. The method is used to treat prostate, prostate/breast or breast cancer when the PA is human PSM, FGPBb and Her2, respectively
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Inducing immune responses to weakly immunogenic, tumor associated peptide antigens for the treatment of breast and prostate cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Leach D, Dalum I;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 9
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The present invention provides a method of treating cancer by administering a conjugate of anti-ErbB antibody with a maytansinoid. In particular, the antibody is directed against ErbB2 (also known as HER2 and pls5neu). The method is particularly useful in the treatment of breast, ovarian, stomach, endometrial, salivary gland, lung, kidney, colon, colorectal, thyroid, pancreatic, prostate and bladder cancers
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Treating tumors, particularly breast cancers, which overexpress an ErbB receptor and does not respond to an anti-ErbB antibody, comprises conjugating the antibody to a maytansinoid.

The invention relates to synthetic therapeutic compounds (antigenic peptides) with enhanced binding to major histocompatibility complex (MHC) molecules and enhanced immunoregulatory properties relative to their natural counterparts. Compounds of the invention are useful for inducing an immune response in a subject and for use in adoptive immunotherapy. They are useful as components of anti-cancer vaccines and to expand immune effector cells that are specific for cancers characterised by expression of the breast cancer antigen, HER-2. Polynucleotides that canced peptides of the invention are useful as hybridisation probes and as primers for the detection of genes of gene transcripts that are expressed in antigen presenting cells (APCs), to confirm transduction of polynucleotides into host cells. The present sequence is human tyrosine kinase-type receptor, HER-2. Compounds of the invention are designed based on the HER-2 antigenic peptide (774-782)

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          120
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The invention relates to a transgenic non-human mammal that produces in its mammary gland cells detectable levels of a native human HER2 protein or its fragment. The transgenic animals are useful as tumour models for testing HER2-directed cancer therapies, and for identifying anticancer agents. The animals may also be used as source of cells which can be immortalised in culture, in screening for compounds that have potential as prophylactic or therapeutic readments of diseases or disorders involving expression of HER2. The anti-cancer molecules are useful for inducting apoptosis or cell death of cancer cells. The present sequence is
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        9
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      9

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        response against a polypeptide antigen in an animal, including human. The method comprises administering the polypeptide antigen or at least one wariant which includes at least one first T-helper cell epitope that is foreign to the animal (foreign TH epitope) and is formulated with chitosan. The polypeptide antigen is weakly immunogenic or nonimmunogenic. The invention is used as vaccine. The chitosan and polypeptide antigen for inducing or enhancing an immune response, particularly CTL response, against the polypeptide or inducing or enhancing an immune response. The method for inducing or enhancing an immune response is useful in the method for inducing or enhancing an immune response is useful in the article or protein antigen. The method for inducing or enhancing an immune response is useful in the article or ameliorating cancer, e.g. prostate or breast cancer. The

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The invention relates to treating a tumour in a mammal, where the tumour is characterised by the overexpression of an epidermal growth factor receptor (ErbB) and does not respond or responds poorly, to treatment with an anti-ErbB antibody, comprising administering to the mammal and anti-ErbB antibody-maytensinoid conjugate. The method, is useful for treating cancer or tumours of the breast, ovary, stomach, endometrium, salivary gland, lung, kidney, colon, colorectum, thyroid, pancreas, prostate and bladder, preferably breast cancer. The breast cancer is a metastatic breast cancer on an aggressive form of metastatic breast cancer which overexpresses ErbB2. The method is also useful for treating neuronal, glial, astrocytal, hypothalamic, glandular, macrophagal, epithelial, stromal, blastocoelic, inflammatory, angiogenic and immunological disorders. This sequence represents the human HER2 (ErbB2) polypeptide of the invention

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The present invention describes a method for assessing whether a patient is afflicted with breast cancer. The method comprises comparing the level of expression of a marker (gene/polypeptide see ACCS0076 to ACCS034 and ABR47386 to ABR47632) in a patient sample and the normal level of expression of the marker in a control non-breast cancer sample, where a patient sample and the level of expression of the marker in the patient sample and the normal level of an indication that the patient is afflicted with breast cancer. The breast cancer associated sequences from the present invention have cytostatic activities and can be used in gene therapy. The method is useful for diagnosing and treating breast cancer. N.B. The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Breast cancer diagnosis or treatment by comparing the level of expression of a marker in a patient sample with that in the control non-breast cancer sample.

Also described is a vaccine or immunotherapeutic composition (VC) comprising (I). (I) has cytostatic activity. VC is useful for treating an animal, by administering to an animal the vaccine or immunotherapeutic composition. VC is also useful for evaluating immunogenicity of a vaccine or immunotherapeutic composition, by administering VC to an HIA-transgenic animal and evaluating immunogenicity based on a characteristic of the animal, or by in vitro primary stimulation of a T cell and evaluating immunogenicity. (I) is useful for determining specific T cell frequency, by contacting T cells with a MHC-peptiale complex, and further comprises ELISPOT analysis, limiting dilution analysis, flow cytometry, in situ hybridisation and/or polymerase chain reaction (PCR).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The present invention relates to peptides and peptidomimetics that bind to the extracellular domain of ErbB2 (also known as HER2 or neu). Sequences of the invention are useful in the diagnosis, prevention and treatment of disorders characterised by ErbB2 overexpression (e.g. breast cancer). The invention is also useful in protein therapy. The present sequence is human c-erbB2 protein
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              for diagnosing, preventing or treating disorders by ErbB2 overexpression (e.g. breast cancer) comprises an peptide that binds specifically to the extracellular domain
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ELTYLPTNASLSFLQDIQEVQGYVLIAHNQVRQVPLQRLRIVRGTQLFEDNYALAVLDNG 120

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          음
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      8
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              This invention relates to a novel medical method comprising providing an implantable microscopic device including a nanostructure provided with a ligand for effectively coupling the nanostructure to a predetermined chemical or molecular site. Specifically, the microscopic device is directly implanted into patients at predetermined sites, and on reaching the target site the nanostructure is activated to perform a preselected medical diagnostic or therapeutic function. Accordingly, the present invention describes using this method for the treatment of various disrupted by activation of the nanostructure, as well as bone injuries and cancer. Furthermore, the target can consist of a microorganism containing a strand of viral DNA, such that heating the nanostructure can destroy the microorganism, which in turn can be used therapeutically to treat HIV patients. This polypeptide sequence is the human erb-B protein that is over expressed in human breast tumour cells and therefore acts as
